

## INTEGRATION

# Fiserv Premier

## Overview

With OpCon's Fiserv Premier integration, you'll get faster, more accurate processing from the Fiserv Premier platform while spending less time managing it. As a result, you'll give your IT team time back to focus on strategic and growth initiatives instead of day-to-day operational tasks—saving you money, time, and resources.

## Use Cases

### 1 Automate ACH batch posting

Users can enable full automation of ACH transaction batch posting and control overrun and processing dates, which are needed for jobs like overnight processing.

### 2 Filter critical Premier messages

Message Management filtering rules make it easier for OpCon users to identify Premier software messages that are critical for automated balancing functions.

### 3 Orchestrate all IBM i jobs

Our industry-leading, customer-driven IBM i agent creates even more value for IBM i users by orchestrating all your jobs as tightly integrated pieces of your whole environment.

### 4 Consolidate database scripting

OpCon's dedicated SQL agent provides a consolidated mechanism for all your database scripting and related activities, manageable through the OpCon interface.

### 5 Trigger complex workflows

Self-service automation empowers users to trigger complex workflows with the push of a button, freeing the IT team from common requests and allowing them to scale their output.

### 6 Integrate automation into other Fiserv apps and third-party programs

Speed up credit card processing, loan origination, and more. OpCon manages all workflows and processes all FTP and payment activity.

## 7 Execute reliable lights-out automation for end-of-day processing

Using OpCon's timesaving, event-triggered workflows that monitor for incoming files and automatically begin processing workflows, IT operations can reliably execute lights-out automation for ACH processing, end-of-day processing, and checking/deposit operations.

## 8 Automate financial balancing functions

The agent's Message Management features and linked Data Capture and Response Rules perform automated financial balancing functions by managing computer program responses to unique Premier program messages.

## Features

File transfer automation

Data capture and response rules

Self-service automation

IBM i agent orchestrates jobs throughout your environment

Automated job scheduling and ACH transaction batch posting

Ability to export/import agent configuration data

Message management filtering rules

SQL agent consolidates all database scripting and related activities

Event-triggered workflows monitor for incoming files
