

OPCON
CLOUD

OpCon Cloud is the cloud-hosted version of OpCon, the only workload automation and orchestration solution built specifically for financial institutions. Before OpCon Cloud, the only option was to host OpCon on premises.

How does OpCon Cloud work?

OpCon Cloud uses military-grade VPN encryption to secure connectivity to your IT infrastructure.

What's included with OpCon Cloud?

- OpCon Deploy, OpCon Vision, & OpCon Self-Service
- The OpCon Server
- The Solution Manager web interface with SSO functionality
- The OpCon Managed File Transfer Server
- Built-in failover & disaster recovery
- 24/7 US-based support
- A VPN connection between OpCon and your environment(s)
- Automatic upgrades and maintenance

“Implementation of OpCon Cloud was incredibly easy. SMA built out our environment, and we worked together to establish the VPN. Then, we jumped right into training, which was exceptional.

Curtis Lewis, IT Project Manager at OUCU Financial

Should I host OpCon in the cloud instead of on premises?

This will depend on your organization's cloud strategy and long-term business strategy. If you're already starting to move some of your critical applications to the cloud, then you should strongly consider moving your mission-critical automation environment to the cloud, too. With OpCon Cloud, you no longer have to manage a data center and all the operations and costs that come with it—allowing your organization to spend more time serving the needs of your members and customers.

How does OpCon Cloud help my organization?

Here are some of the key ways OpCon Cloud is designed to support your organization's current and long-term business strategy and mission-critical priorities as your IT environment grows increasingly complex:

Experience productivity gains

Get even more time back to focus on what matters, so you can drive innovation and increase employee engagement and retention. Plus, with OpCon Cloud, you can access OpCon anywhere, making it even more convenient to implement and manage your business-critical automation.

Ensure business continuity

OpCon Cloud makes sure your applications and data are protected with military-grade 256-bit AES encryption. It takes care of and secures all of your backups and will ensure normal operations resume quickly in the event of a disaster.

Enable scalability

Eliminate the cost of expensive IT hardware, software licensing fees, and the need to hire additional staff to support your infrastructure. You'll no longer need to manage a data center, experience downtime for manual software upgrades, or worry about maintaining or upgrading your processing and storage capacity to manage increased workloads. OpCon Cloud takes care of all of that for you, so you can free up your IT team's time and resources for more strategic projects that keep you ahead of your competition.
